

ABSTRACT

A step of a method applies a coating material to an electric coil of a workpiece. Before, after, or before and after that step, another step directs a first heated gas flow to impinge on the workpiece. An embodiment of apparatus includes first, second, and third mechanisms. The first mechanism directs a first heated gas flow to impinge on the workpiece. The second mechanism applies a coating material to the electric coil. The third mechanism relatively transports the workpiece between the first mechanism and the second mechanism.
